

From validated staging prototype to production readiness

Future development is prioritised by measured defects, operational risk and real user needs.

NEAR TERM

Quality and accessibility

- + Correct retained AI extraction, contrast, reflow and upload findings
- + Independent WCAG 2.1 AA audit
- + Broader JAWS, NVDA, mobile and real-user validation

MEDIUM TERM

Production and cost control

- + Non-sleeping services, monitoring and recovery
- + Per-user AI/voice quotas and budget alerts
- + Profile queries, add indexes, then cache only repeated non-sensitive reads

LONG TERM

Product evolution

- + Accessible RAG chatbot using verified knowledge
- + Human-controlled AI interview preparation
- + More hospitality roles, training programs and employer partnerships

Scale and automation will follow measured evidence; accessibility, explainability and human control remain mandatory.

A validated bridge from ability to opportunity

The contribution is a tested engineering platform with explicit evidence, limitations and human control.

Delivered engineering contribution

- + Accessible English, French and Arabic role workflows
- + Protected Symfony security and business boundary
- + Deterministic, explainable task-level matching
- + Candidate-controlled AI and bounded voice assistance
- + PostgreSQL data and purpose-specific object storage
- + Repeatable cloud staging and retained verification evidence

Evidence at final evaluation

4 protected roles

3 interface languages

310 executed staging cases

93.2% final staging pass rate

Human validation: 20-person Arc en Ciel session plus a separate JAWS workflow.

Join Hospitality demonstrates that inclusive recruitment can be engineered through accessible interaction, task-level evidence, deterministic decisions and human oversight.
